A Masonry Built – In Wall System Without A Continuous Concrete Foundation

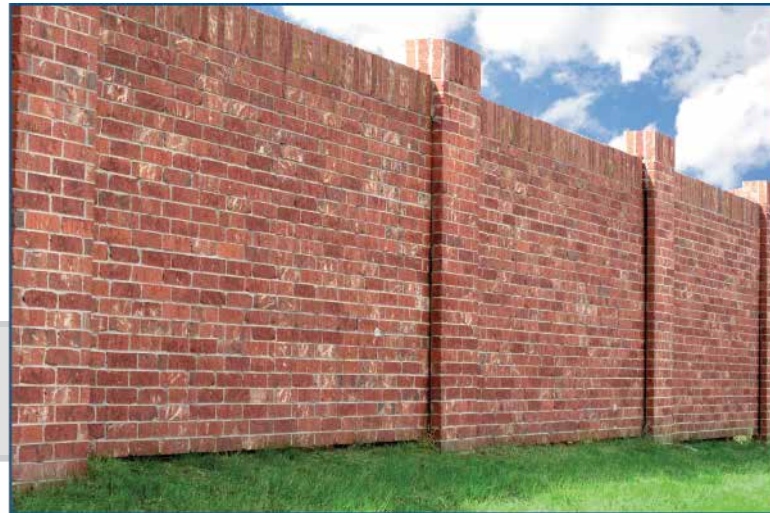

Single Wythe

The Benefits of Fencecrete America's "Single Wythe Beam" Design:

**Privacy • Security • Prestige • Permanence • Lower Cost
Maintenance Free • Less Brick • Less Labor-Intensive**

The "single wythe beam" concept simply an engineered beam supported between two reinforced concrete and brick piers.

This method of installation allows each panel to move with the expansion of the surrounding soils which eliminates breaks and cracks in your fence.

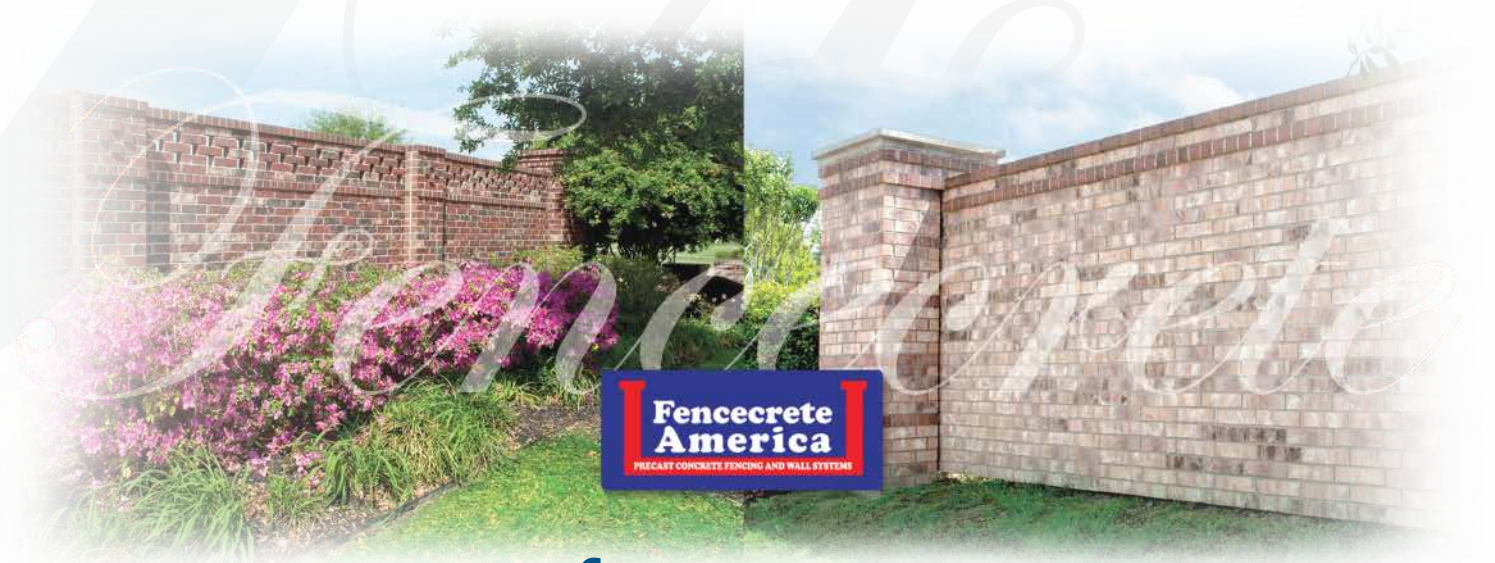

We can build to any design and specifications, and surround any property with a beautiful maintenance-free wall that will last forever.

The "single wythe beam" panel supports itself without a continuous concrete foundation.

The classic beauty of wrought iron is added to the "single wythe beam" concept for a permanent wall that can be designed to your specifications.

"We'll never relax quality standards. We'll meet and exceed customers' expectations. That's our answer to the competition!"
